

# MATLAB for Psychologists

CdL Scienze e Tecniche Psicologiche  
a.a. 2018–2019

ANDREA FROSINI  
e-mail: [andrea.frosini@unifi.it](mailto:andrea.frosini@unifi.it)

Testo di riferimento:

M. Borgo, A. Soranzo, M. Grassi  
“MATLAB for Psychologists”

Springer

**errata corrige, scripts and listings from the book:**

<https://dpg.unipd.it/en/mlp/matlab-book>

# Chapter 1 – Basic Operations

Step zero: get used to the environment, create a directory where save and open your file(s).

Basic arithmetical operators:

To type after prompt >> followed by Enter	MATLAB answer	meaning
35+12	ans = 47	sum
35*12	ans = 420	multiplication
2/45	ans = 0.0444	division
2-1	ans = 1	subtraction
2^3	ans = 8	exponentiation
12/0	ans = Inf	infinity
0/0	ans = NaN	Not a Number
11+	??? 11+	expression error

# Chapter 1 – Variables

A variable can be regarded as a labeled box having a prescribed dimension which contains a *certain type of data* (automatically created and dynamically updated according to the context)

Create, update and recall a variable:

<pre>&gt;&gt;pippo=9 Ans= 9</pre>	<pre>&gt;&gt; pippo Ans= 9</pre>
<pre>&gt;&gt;pippo='ciao mamma' Ans= ciao mamma</pre>	<pre>&gt;&gt;pippo Ans= ciao mamma</pre>

**Task:** enjoy updating variables and make arithmetical operations on them. Keep track of their changes in the Workspace.

*N.B. Using semicolon ; at the end of a command prevents the command to be echoed on the screen*

# Chapter 1 – Vectors and Matrices

Let us create vectors and matrices and recall them:

```
>>a=[1,2,3,4];
```

```
>>b=[1;2;3];
```

```
>>c=[1,2,3,4;5,6,7,8;9,10,11,12];
```

Vectors' dimension changes!!!

a (row) vector	b (column) vector	c 3x4 matrix	Assign value	ATTENTION!
1 2 3 4	1 2 3	1 2 3 4 5 6 7 8 9 10 11 12		>>d=5 d=5
>>a(2) Ans= 2	>>b(0,1) error	>>c(3,2) Ans= 10	>>a(1,2)=6 Ans= a= 1 6 3 4	>>d(2)=6 d= 5 6

N.B. the followings are useful functions

>>size(c) Ans= 3 4	>>length(a) Ans= 4	>>length(b) Ans= 1
--------------------------	--------------------------	--------------------------

# Chapter 1 – Vectors and Matrices (nice tricks)

Address more than one element at a time:

<code>&gt;&gt;c([1,3];4)</code>	<code>&gt;&gt;c(2;1:3)</code>	<code>&gt;&gt;c(:,1)</code>	<code>&gt;&gt;c(:,[2,4]) = []</code>
1 2 3 <b>4</b> 5 6 7 8 9 10 11 <b>12</b>	1 2 3 4 <b>5 6 7</b> 8 9 10 11 12	<b>1</b> 2 3 4 <b>5</b> 6 7 8 <b>9</b> 10 11 12	1 <b>2</b> 3 <b>4</b> 5 <b>6</b> 7 <b>8</b> 9 <b>10</b> 11 <b>12</b>
Ans= 4 12	Ans= 5 6 7	Ans = 1 5 9	Ans = c= 1 3 5 7 9 11

Useful functions and operations: let  $d=[2,4;5,7;9,11;1,0]$ ,  $e=[7,8,9,0]$

<code>&gt;&gt;size(c)</code> Ans= 3 4	<code>&gt;&gt;length(c)</code> Ans= 4	<code>&gt;&gt;length(a)</code> Ans= 4	
<code>&gt;&gt;2*a</code> Ans= 2,4,6,8	<code>&gt;&gt;a+e</code> Ans= 8 10 12 4	<code>&gt;&gt;c*d</code> Ans=43 51 111 139 179 227	<code>&gt;&gt;d' % transposition</code> Ans = 2 5 9 1 4 7 11 0

**Exercises 1,2 and 3 are suggested**

# Chapter 2– Data Handling

MATLAB stores **logical values** and **strings** in addition to **numbers** into variables, with simple or structured data types.

Handling **Logical Variables**:

A logical variable stores the two logical data

**FALSE** represented by **0**;

**TRUE** represented by any nonzero (usually **1**) number.

The function *logical(x)* converts the elements of the vector *x* into logical values

The *relational operators* that can be used in MATLAB are:

< (less) , <= (less or equal), > (greater), >= (greater or equal), == (equal), ~= (not equal)

The *logical operators* that can be used in MATLAB are:

& (AND) , | (OR), ~ (NOT)

# Chapter 2– Data Handling

Examples of the use of logical variables and operators **(TO BE UNDERSTOOD)**:

let a=[0,1,2,3,4], b=[3,2,0,1,7]

<pre>&gt;&gt;5&gt;3 Ans= 1</pre>	<pre>&gt;&gt;logical(a) Ans= 0 1 1 1 1</pre>	<pre>&gt;&gt;a&gt;b Ans= 0 0 1 1 0</pre>	<pre>&gt;&gt;c= a==3 c= 0 0 0 1 0</pre>	<pre>&gt;&gt;x=3; 0&lt;x&lt;2 Ans= 1</pre> 	<pre>&gt;&gt;(x&gt;0)&amp;(x&lt;3) Ans= 0</pre> 
<pre>&gt;&gt;c=(b&gt;=3) (b&lt;1) c= 1 0 1 0 1 &gt;&gt;d=b(c) d= 3 0 7</pre>		<pre>&gt;&gt;e= a((b&gt;=3) (b&lt;1)) e = 0 2 4</pre>		<pre>&gt;&gt;any(a) Ans = 1 &gt;&gt;f=[0,0,0]; any(f) Ans = 0</pre>	<pre>&gt;&gt;all(a) Ans= 0 &gt;&gt;f=[1,2,3];all(f) Ans=1</pre>
<pre>&gt;&gt;exist('a') Ans = 1 &gt;&gt;exist('z') Ans=0</pre>		<pre>&gt;&gt;isempty(a) Ans = 0 &gt;&gt;f=[];isempty(f) Ans = 1</pre>		<pre>Etc...</pre>	<pre>Etc...</pre>

N.B. the example in cell (1,5) needs a further comment: MATLAB resolves the command  $0 < x < 2$  as follows

- 1) it computes  $0 < x$  that is true so it gives **1** as result;
- 2) it computes  $1 < 2$  that is true, giving **1** as Ans.

# Chapter 2– Data Handling

Handling **Strings**:

A string is a **sequence of characters** and are treated by MATLAB as **vectors**

If we need a sequence of strings, then we have to use the function **char** that creates a **matrix of strings**, each in a different row

```
>>a='Mario'  
a= Mario  
>>a(2)  
Ans= a
```

```
>>b='Luigi'  
>>c=[a,' ',b]  
c= Mario Luigi
```

```
>>c=a; c(2)=b  
Error
```

```
>>c=char(a,b)  
c= Mario  
Luigi
```

```
>>lower(a)  
Ans = mario  
>>upper(a)  
Ans= MARIO
```

```
>>strcmp(a,b)  
Ans= 0  
>>strcmp(a,c(1))  
Ans=1
```

```
>>strrep(a,'a','b')  
Ans=Mbriob  
% replace the occurrences of 'a' with 'b' in a
```

```
>>findstr(b,'i')  
Ans= 3 5  
% return the indexes of each occurrence  
of 'i' in b
```

# Chapter 2– Data Handling

Handling (formatted) **Strings**:

Data values or variables can be inserted into a string:

```
let a='Mario', b='Luigi',eta=[21,22]
```

```
>>printf('Il nome del mio amico e' %s ed ha %d anni',a,eta(1))
Ans= Il nome del mio amico e' Mario ed ha 21 anni
>>printf('Il nome del mio amico e' %s ed ha %d anni',b,eta(2))
Ans= Il nome del mio amico e' Luigi ed ha 22 anni
```

Special characters spec.:

- %c – single char
- %d – integer number
- %s – string of chars
- %f – decimal number
- \n – newline
- \t – horizontal tab

## INPUT

```
>>input('How old are you? ')
How old are you? 35
Ans = 35
```

```
>>input('How old are you?','s')
How old are you? Thirty five
Ans = Thirty five
% 's' is for string inputs
```

```
>>a= input('Name a friend ','s')
Name a friend Luca
a = Luca
```

# Chapter 2– Data Handling

Handling **NaN**:

NaN means *Not a Number* and is used for missing data.

Doing mathematical operations involving NaN return NaN.

```
>>pippo=[12, NaN, 5, NaN, 0, 3]
Pippo = 12 NaN 5 NaN 0 3
>>isnan(pippo)
Ans = 0 1 0 1 0 0
```

```
% isnan(pippo) return an array with 1 in NaN positions
of pippo, 0 otherwise
```

```
>>mean(pippo)
Ans = NaN
>>mean(pippo(~isnan(pippo)))
Ans= 5
```

# Chapter 2– Data Handling

Handling **Structures**:

Structures are *structured data types* that can be regarded as **vectors** of **different primitive** (i.e., numbers, boolean and strings) **data types**.

Each element is called *field*. As usual, examples will clarify the use; let us assume we want to store the participants of an experiment:

```
>>subject.name='Mario'  
>>subject.surname='Rossi'  
>>subject.age=24  
>>subject.testanswers=[2,1,4,1,2]  
>>subject.testcorrections=logical([1,0,0,1,1])  
>>subject  
Subject=  
  name: 'Mario'  
  surname: 'Rossi'  
  age : 24  
  testanswers : [2,1,4,1,2]  
  testcorrections : 1 0 0 1 1
```

```
>>subject(2).name='Luigi'  
>>subject.age=20  
>>subject.testanswers=[1,1,2,2,2]  
>>subject(2)  
Ans =  
  name: 'Luigi'  
  surname: []  
  age : 20  
  testanswers : [1,1,2,2,2]  
  testcorrections :  
>>rmfield(subject,'testanswers')  
Ans = name  
  surname  
  testanswers  
  testcorrections
```

# Chapter 2– Data Handling

Handling **Cells** (skipped).

## Import/Export:

In MATLAB it is extremely useful to **save** and **load variables** to and from **files** for further working sessions, since the program deletes them as soon as you quit.

```
>>clear all % clear all the variables in the
workspace
>>a='Mario'
>>b='Luigi'
>>c=[1 2 3 5 NaN]
>>save pippo % creates in the working
directory the file pippo.mat storing the
current values of the three variables a,b and c
```

```
>>a='Luca'
>>load pippo
>>a
a = Mario
>>uiimport
% import the data from a
selected file
```

```
>>a='Luca'
>>b='Camilla'
>>save pippo a b
% update in pippo.mat only the
variables a and b
```

Exercises 1 and 2 are suggested

Check carefully the code for the mean at pg.45

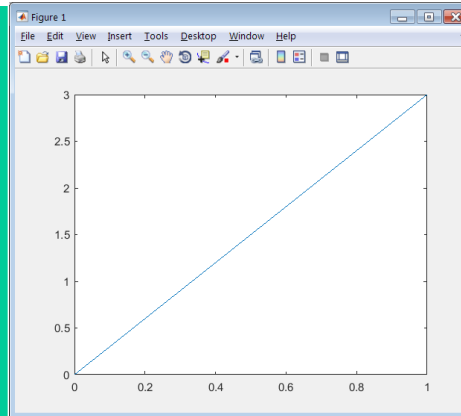

# Chapter 3– Plotting Data

MATLAB plots data in many different ways:

the simplest (and the only one considered here) is the *plot* command that inputs two sequences  $(x_1, x_2, \dots, x_n)$  and  $(y_1, y_2, \dots, y_n)$  of numbers and draws the polyline connecting  $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ .

**Useful hints:**  $x=[0:0.2:1]$  lists all the values from 0 to 1 with 0.2 step, i.e.,  $x=[0,0.2,0.4,0.6,0.8,1]$ ,  $y=3*x$  creates a vector  $y=[0,0.6,1.2,1.8,2.4,3]$

```
>>x=[0:0.2:1]
x= 0 0.2 0.4 0.6 0.8 1
>>y=3*x
y=0 0.6 1.2 1.8 2.4 3
>>plot(x,y)
```

```
>>plot(x,y,x,x.*x)
%.* is the element by
element product in
vectors
```

There are several plot command options to set the appearance of the figure: line aspect, line color, axes width, legends, title, labels etc... They will be treated if needed.

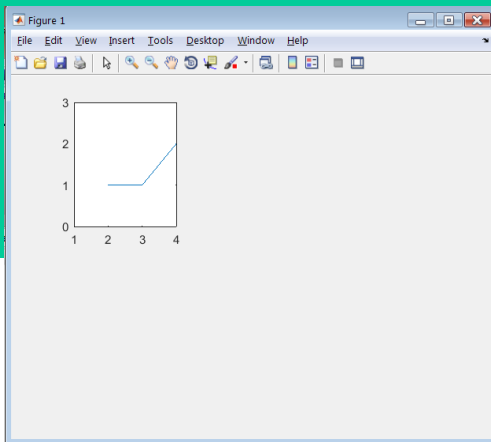

# Chapter 3– Plotting Data

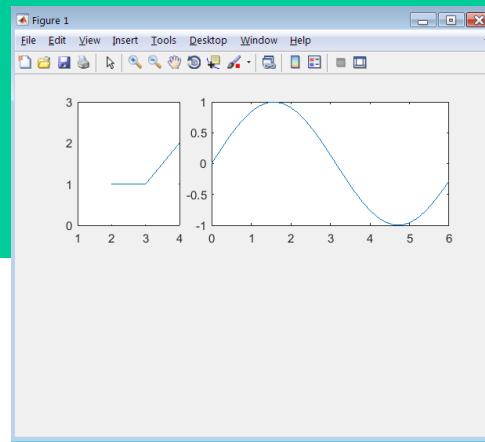

To display multiple graphics in one figure one can use the *subplot* sommand.

The figure area is considered as a **matrix** and each draw is placed where desired, accordingly. The syntax of the command is `>>subplot(Nrows,Ncolumns,Position)`, where **Nrows** and **Ncolumns** are the rows and columns of the matrix division of the area, and **Position** is the area where the plot has to be placed. Areas are numbered from top to bottom and from left to right.

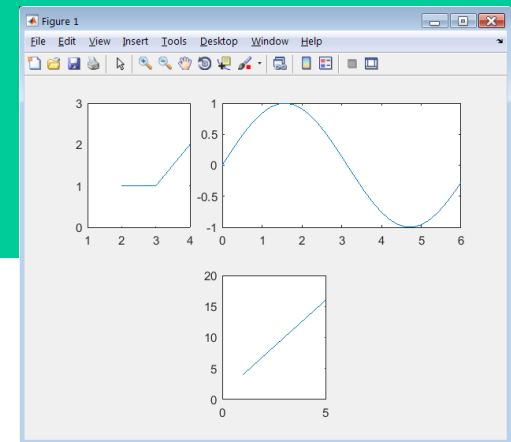

```
>>subplot(2,3,1)  
>>plot([2,3,4],[1,1,2])  
>>axes([1,4,0,3])
```

```
>>subplot(2,3,[2,3])  
>>x=[0:0.2:6]  
>>plot(x,sin(x))
```

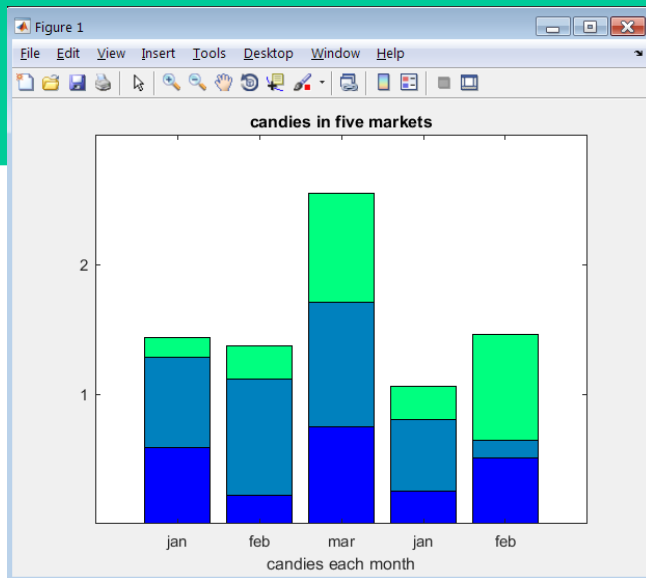

```
>>subplot(2,3,5)  
>>x=[1:0.2:5]  
>>plot(x,3.*x+1)
```

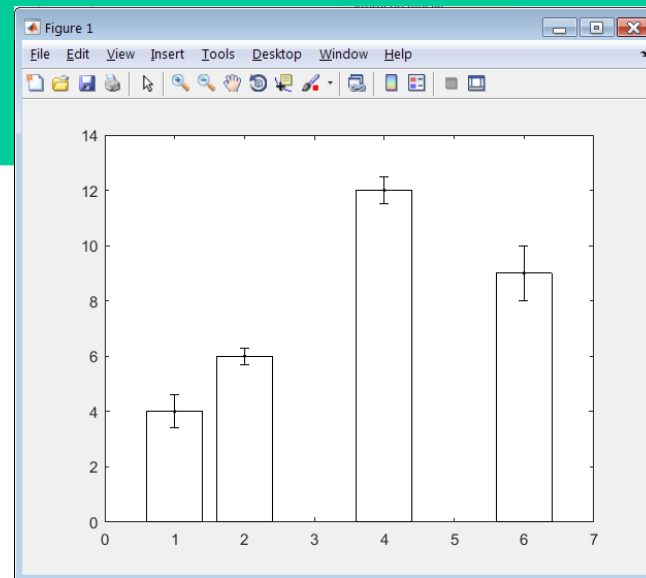

# Chapter 3– Plotting Data

**Common ways to display data:** let `rand(r,c)` creates a  $r \times c$  matrix with random data in  $[0,1]$  interval

```
>> bar(rand(5,3),'stacked')
>> colormap(winter)
>> title('candies in five markets')
>> set(gca,'XTickLabel',{'jan','feb','mar'})
>> set(gca,'YTick',[1,2])
```

```
>> x=[1,2,4,6]; values=[4,6,12,9]
>> dev=[0.6,0.3,0.5,1]
>> bar(x,values,'w'); hold on;
>> errorbar(x,values,dev,'.k')
```

# Chapter 3– Plotting Data

## Useful hint:

if one needs a matrix (vector) with **integer random values** in the interval  $[1,n]$ , use the command

```
>>fix(mod(rand(r,c).*10*n,n))
```

where *fix* returns the integer part of a number, and *mod(x,y)* returns the remainder after division of  $x$  by  $y$

**After studying this chapter be also AWARE of:**

- different kinds of graph representations
- how to change graph properties using *set* command
- 3D data representations
- use of *hold on* command (do not allow a plot to replace the previous)
- use of *print* command

Exercises at will

# Chapter 3– Plotting Data

## Exercise:

store in a struct variable *test* the results of a five Lickert levels – six items test obtained from 12 subjects together with their name, surname and gender (use the random generator to obtain the results).

Then show the following three graphs at the same time:

- for each item, the number of each result by a bar in a six bar bargraph;
- the polyline of the total points obtained by the 12 subjects;
- the mean and the sd of the obtained results using the errorbar in a six bar bargraph .

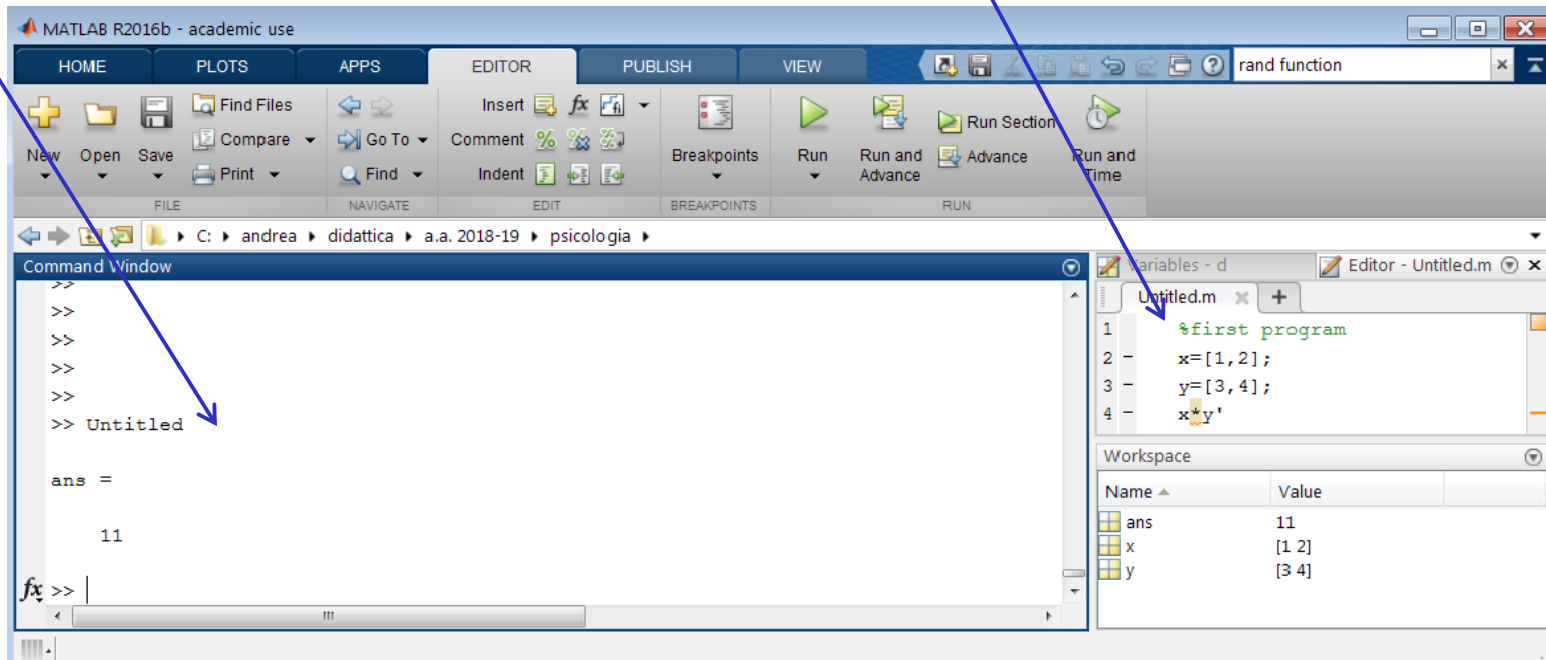

Add to the variable *test* a further field storing the total points obtained by each subject.

# Chapter 4– Start Programming

From now on we acquire the possibility of writing **sequences of (structured) commands** in a friendly and immediate way.

To do that, MATLAB provides a **text editor** accessible from the **EDITOR** label.

You write your sequence of commands on the **right panel** and run them on the **left panel** simply typing the name of the related file (hereafter **Untitled.m**, saved automatically in the working directory. The name can obviously be changed.)

# Chapter 4– Start Programming

## Control flow statements

### Cycles and Conditionals: *if*

#### Syntax

```
if condition  
statement1  
else  
statement2  
end
```

#### Multiple conditions

```
if condition1  
statement1  
elseif condition2  
statement2  
elseif  
...  
else  
statementn  
end
```

#### Semantic

If condition is true **then** statement1 is performed and go to end, **else** statement2 is performed.

#### Multiple conditions

If condition is true **then** perform statement1 and go to end, **else if** condition2 is true **then** perform statement2 and go to end, **else ...** **else** statementn is performed.

An alternative to the if – else form is the switch – case form that sometimes leads to more readable code.

# Chapter 4– Start Programming

## Control flow statements

### Cycles and Conditionals: *if*

```
Test_if.m
x=input('Insert a number greater than zero:')
if x>0
    disp('true')
else
    disp('false')
end;
```

```
>> Test_if
Insert a number greater than zero: 45
>> true
```

```
Test_mult_if.m
x=input('Insert test result [0-30]:');
if x<18
    disp('try again')
elseif x<30
    disp('Good result: you pass!')
elseif x=30
    disp('Awesome!!!')
else
    disp('you cheater')
end;
```

```
>> Test_mult_if
Insert test result [0-30]: 28
>> Good result: you pass!
```

# Chapter 4– Start Programming

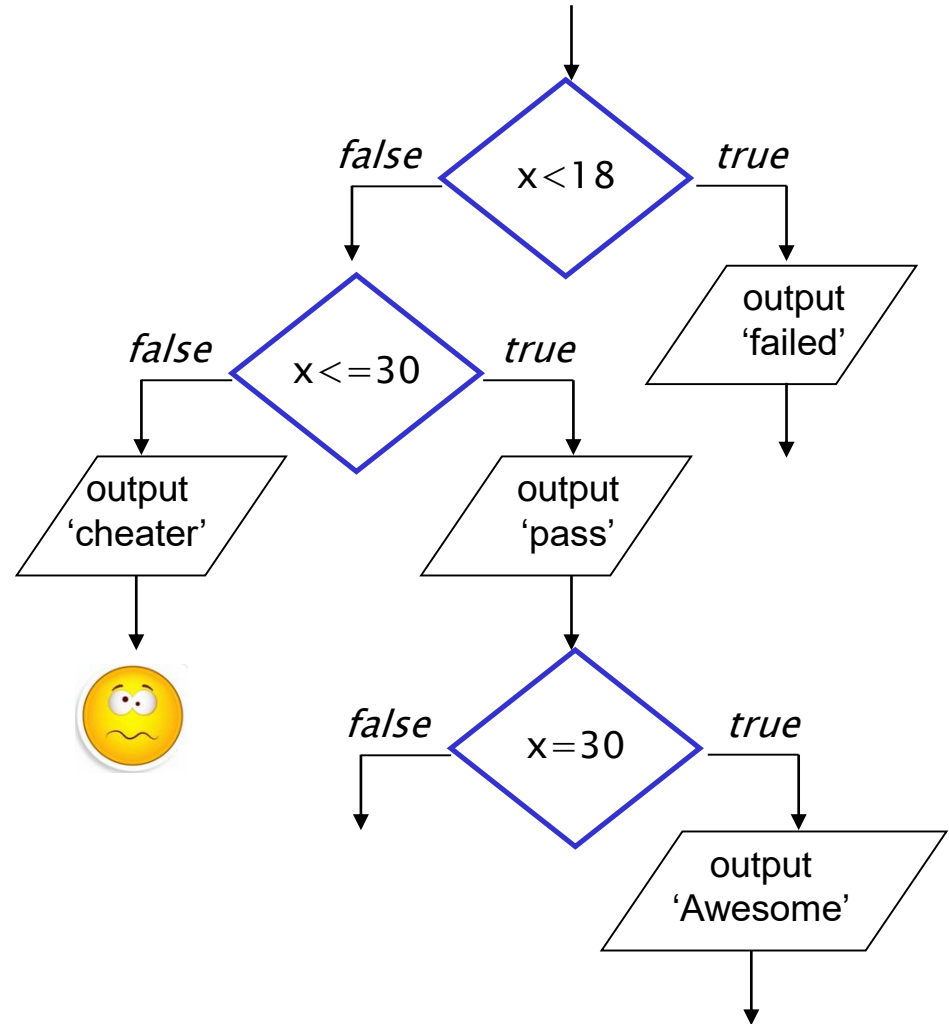

## Control flow statements

### Cycles and Conditionals: *if*

Test\_nested\_if.m

```
x = input('Insert test result [0-30]:','s');  
if str2num(x)<18  
    disp('you failed')  
elseif str2num(x)<=30  
    disp('Good result: you pass!')  
    if strcmp(x,'30')  
        disp('Awesome!!!')  
    end;  
else  
    disp('you cheater')  
end;
```

```
>> Test_nested_if  
Insert a number greater than zero: 30  
>> Good result:you pass!  
>> Awesome!!!
```

# Chapter 4– Start Programming

## Control flow statements

**For Loops:** it fulfills the need of repeating a block of statements a number of times

### Syntax

```
for var in list_of_values  
statement  
end
```

```
for var in start:step:stop  
statement  
end
```

### Semantic

The variable *var* takes all the values in *list\_of\_values* and **for each of them** *statement* is performed

The variable *var* takes all the integer values from *start* to *stop* each time increasing/decreasing of *step* and **for each of them** *statement* is performed

# Chapter 4– Start Programming

## Control flow statements

The image shows the MATLAB R2016b interface. The Command Window on the left displays the execution of a script. The script in the Editor on the right contains the following code:

```
1 %first program
2 list=[1,2,3,4];
3 disp('first for');
4 for i=list
5     disp(i);
6 end;
7 disp('second for');
8 for i=0:3
9     disp(i);
10 end;
11 disp('third for');
12 for i=x
13     disp(i);
14 end;
```

The Command Window output shows the results of the script execution:

```
>> x=[1,2]
x =
     1     2
>> Untitled
first for
1
2
3
4
second for
0
1
2
3
third for
1
2
```

A sad face emoji is placed next to the output of the second for loop. The Workspace window at the bottom right shows the current state of the workspace:

Name	Value
i	2
list	[1 2 3 4]
x	[1 2]

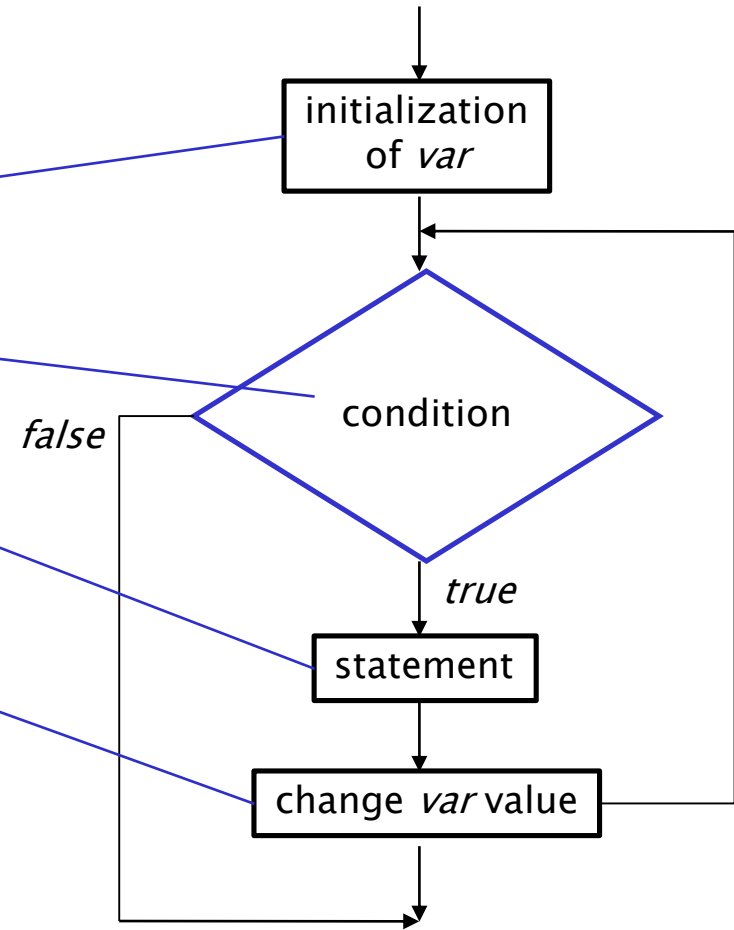

# Chapter 4– Start Programming

## Control flow statements

**For Loops:** it fulfills the need of repeating a block of statements a number of times

```
Test_for.m
for var=3:2:10
    disp('the value of var is %d',var)
end;

>> Test_for
3
5
7
9
```

# Chapter 4– Start Programming

## Control flow statements

**While Loops:** it repeats a block of statements *while* a condition is true (so indefinitely many times)

The **while** and the **for** loops can be used equivalently; they are only *more adequate* to different situations.

```
% mean of a vector x
```

```
Nelem=length(x);  
mean=0;  
Index=1;  
while index<=Nelem  
    mean=mean+x(index);  
    index=index+1;  
end  
mean=mean/Nelem;  
disp(sprintf('the mean of x is %2.1f',mean));
```

```
%create a menu
```

```
ans='';  
ansvect=char('S','V','E');  
while ~(ismember(ans,ansvect))  
    disp('Do your own choice:');  
    disp('S: start experiment');  
    disp('V: visualize last trial's result');  
    disp('E: exit');  
    ans=input('Do your own choice','s');  
end;  
disp('good choice');
```

Listing 4.9 shows an interesting and simple application of while loop for adaptive procedures

# Chapter 4– Start Programming

## Control flow statements

***break***: break command forces the exit from a loop, sometimes it is very useful  
the following is a quite artificial example

```
% mean of a vector x using break
Nelem=length(x); mean=0; index=1;
while 1      % neverending loop
    mean=mean+x(index);
    index=index+1;
    if index<Nelem
        break;
    end;
end;
disp(sprintf('the x mean is %2.2f',mean));
```

**Read** the paragraph *Try-Catch*

**Skip** the paragraph *Loop Versus Matrices and if Versus Logicals*

# Chapter 4– Start Programming Functions

*Scripts* that receive **INPUTS** and return results as **OUTPUTS** are called *functions*. Examples of “built-in” functions in MATLAB are *sin*, *sum*, *length* ...

Functions scripts start with the reserved word *function* and the *.m* file has to **match** the **name of the function**:

The screenshot displays the MATLAB R2016b environment. The Command Window on the left shows the execution of a script named `prima_func.m`. The script defines a function `prima_func(x)` that takes a vector `x` and returns the maximum value `a` and the number of occurrences `b`.

```
>> x=[1,2,4,2,4,3,2,2]

x =

     1     2     4     2     4     3     2     2

>> help prima_func
mia prima funzione
che prende un vettore e restituisce
il massimo valore presente ed il
numero di volte che tale valore compare

>> [a,b]=prima_func(x)

a =

     4

b =

     2
```

The Editor window on the right shows the source code of `prima_func.m`:

```
1 function [max, nmax] = prima_func(x)
2 % mia prima funzione
3 % che prende un vettore e restituisce
4 % il massimo valore presente ed il
5 % numero di volte che tale valore compare
6 %
7 max=x(1);
8 for i=2:length(x)
9     if x(i)>max
10        max=x(i);
11    end
12 end
13 nmax=0;
14 for i=1:length(x)
15     if x(i)==max
16        nmax=nmax+1;
17    end
18 end
```

The Workspace window at the bottom right shows the current state of the workspace:

Name	Value
a	4
ans	4
b	2
x	[1 2 4 2 4 3 2 2]

# Chapter 4– Start Programming Functions

**ATTENTION:** the input and output variables are dummies and serve only to point out how the function communicates with the workspace

The image shows the MATLAB R2016b interface. The Command Window on the left displays the execution of a function. The Editor on the right shows the source code for the function `prima_func.m`. The Workspace window at the bottom right shows the variables `a`, `ans`, `b`, and `x` with their respective values.

```
>> x=[1,2,4,2,4,3,2,2]

x =

     1     2     4     2     4     3     2     2

>> help prima_func
mia prima funzione
che prende un vettore e restituisce
il massimo valore presente ed il
numero di volte che tale valore compare

>> [a,b]=prima_func(x)

a =

     4

b =

     2
```

```
function [max, nmax] = prima_func(x)
% mia prima funzione
% che prende un vettore e restituisce
% il massimo valore presente ed il
% numero di volte che tale valore compare
%
max=x(1);
for i=2:length(x)
    if x(i)>max
        max=x(i);
    end
end
nmax=0;
for i=1:length(x)
    if x(i)==max
        nmax=nmax+1;
    end
end
```

Name	Value
a	4
ans	4
b	2
x	[1 2 4 2 4 3 2 2]

# Chapter 4– Start Programming Functions

## *Scope of variables*

visibility or accessibility of a variable from different parts of the program

When a function is called, the **variables** defined **inside it** are **created** (if already present **the old ones are frozen**) and lasts **till the end** of the function. Those variables are called **LOCAL VARIABLES**.

**GLOBAL VARIABLES**: usually written in capital letters, they are defined in the workspace and they are accessible from all the procedures.

**PERSISTENT VARIABLES**: they can be defined only inside functions and live in the space where they are created. They persist between successive calls of the function.

# Chapter 4– Start Programming Functions

*Scope of variables:* examples

LOCAL VARIABLES	GLOBAL VARIABLES	PERSISTENT VARIABLES
<pre>&gt;&gt;x=2 function test_loc x=0  &gt;&gt;test_loc x = 0 &gt;&gt;x x = 2</pre> 	<pre>&gt;&gt;global MYVAR; MYVAR=0  Test_glob.m disp(MYVAR); MYVAR=MYVAR+1; fprintf(' ancora %d \n',MYVAR);  &gt;&gt;test_glob MYVAR = 0 MYVAR = 1 &gt;&gt;MYVAR MYVAR = 1 &gt;&gt;test_glob MYVAR=1 MYVAR=2</pre>	<pre>function [z] = test_pers() persistent y; if isempty(y)     y=0; end y=y+1; z=y;  &gt;&gt;test_pers Ans = 1 &gt;&gt;y Undefined y variable &gt;&gt;test_pers Ans=2</pre>

# Chapter 4– Start Programming Functions

**Change the number of inputs and outputs:** if we need to change the number the inputs of a function, we have to use the *varargin* (variable arguments in) and *nargin* (number of arguments in) variables.

If we need to do the same with the outputs of a function, we similarly have to use the *varargout* (variable arguments out) and *nargout* (number of arguments out) commands.

*Varargin* and *varargout* are **cells variables**, i.e., arrays of input variables whose access to the *i*-th element is *varargin{i}*, and *varargout{i}* (see their use in the example below). *Nargin* and *nargout* are integers.

```
function [mea, varargout] = test( x,varargin )
fprintf('Number of input: %d\n',nargin);
fprintf('Number of output: %d\n',nargout);
Nelem=length(x);
Selem=sum(x);
for i=1:nargin-1
    Nelem=Nelem+length(varargin{i});
    Selem=Selem+sum(varargin{i});
end
mea=Nelem;
varargout{1}=Selem/Nelem;
```

```
>>x1=[2,3,1,2];x2=[3,9];x3=8;
>> [y]=test(x1)
Number of input: 1
Number of output: 1
y = 4

>> [y,z]=test(x1,x2,x3)
Number of input: 3
Number of output: 2
Y=7
z=4
```

# Chapter 4– Start Programming Functions

## *Change the number of inputs and outputs – additional exercises*

1. compute the maximum and minimum (2 different outputs) of a sequence of numbers (or vectors of numbers) passed as arguments of a function
2. propose a Menu that, according to the choices Max or Min, applies the previous function to a sequence of numbers provided as input by the user. In addition the menu proposes a third choice to play “*paper, scissors or stone*” in one player mode (the game has to be fair, so use the random function), keeping track of the best players in the Hall of Fame (hint: use the structure HOF global variable) to be displayed on demand.

# Chapter 4– Start Programming

## More on Data import/Export

### *Script Examples*

**Handling files** (creating, saving, updating them) **is not an easy task**: the general philosophy that lies behind these actions involves the use of an **integer pointer** variable (say **handler**), i.e., a number that **keeps track** of the **last examined symbol** of the file.

The last symbol of a file is called **eof**(End of File).

To interact with a file, it has to be

- **opened** (the pointer is set in its first position);
- **read** (the pointer increases its value by one or more positions);
- **updated** (a symbol can be changed or new symbols can be added at its end);
- **closed** (the pointer variable is trashed) after its use.

Each action obviously has its own command to be performed:

# Chapter 4– Start Programming

## More on Data import/Export

*Script Examples (see pg.91, listing 4.15)*

```
function displayfile(filename)
x=fopen(filename);

if x== -1
    fprintf('Unable to open %s \n',filename);
else

    while ~(feof(x))

        line=fgetl(x);

        disp(line);
    end

    fclose(x);
end
```

*fopen(filename)* open the file *filename* and set the handler *x* to its first position.

The command *fopen* returns *-1* if the file is not found or problems in its opening occurred.

*feof(x)* checks if *x* reached the last position of the file, i.e., the *eof* position, and returns the related boolean.

*fgetl(x)* read the file from the handler till the end of the line.

*fclose(x)* close the file by unsetting its handler *x*.

# Chapter 4– Start Programming

## More on Data import/Export

### *Script Examples*

The command `fopen(filename,option)` presents different behaviors according to the option:

- ‘r+’ : the file is opened in read-only mode. No modifications are allowed:
- ‘w’ : the file is opened in read\write mode. It allows modifications and if it does not exist, it is created;
- ‘a’ : the file is opened in append mode, i.e. it can be modified and the pointer is set to the eof position. Again if the file does not exist, it is created.

The other reading/writing commands may have different options too, that will be used if needed.

Listing 4.16 shows an interesting example of file creation related to an experiment about *iconic memory*.

# Chapter 4– Start Programming

## Guidelines for a Good Programming Style

**Writing code:** some hints on how to write a good code:

- **modularity** is a winning strategy (small and well designed functions are useful and easy to be reused). Define clearly INputs and OUTputs.
- check the **variables life** and **values** prompting them as much as possible. Do donkey tests inserting strange and unexpected inputs. Communicate errors to the users;
- use **indentation!**
- **comment** your script and use instructions on how functions work.
- use **meaningful variables**, also with long names if necessary.
- use the **debug functionality**. MATLAB has it by default and can be activated using breakpoints (see *Debug* section of the book).

### **LAST BUT NOT LEAST**

**do the suggested exercises and dirty your hands writing down lines of code.**

**At the end of this chapter you should be able to complete exercises 1.1,1.2,2,3,5, read and understand A Brick of an Experiment,pg.102, and listings 4.18 and 4.19.**

# Chapter 5–A Better Sound

## Generate a Sound

MATLAB provides an easy way to create and manipulate sounds. In the next slides there is a sketch of what it can be done.

## Characteristics of SOUND WAVE

### Terms related to a wave:

#### Oscillation

One complete to and fro motion, where one full wave is constituted. From fig, If a wave starts from 'A', it completes full wave at 'C', making one oscillation.

#### Wavelength

Length of a wave along x-axis, represented by ' $\lambda$ ' (lambda). From fig, AC is the wave length. It is measured in Angstrom unit (A).  
 $1 \text{ A} = 10^{-10} \text{ m}$

#### Amplitude

The maximum displacement of a wave on either side of its mean position. From fig, XY is the amplitude of the wave.

#### Time period

The time taken by a wave to complete one oscillation. It is denoted by 'T'.

#### Frequency

The number of oscillations made by wave in one second. It is denoted by 'n' or 'f'. Its unit is hertz (Hz).

### Relation between Time period and Frequency

$$\text{Time period} = 1/\text{Frequency}$$

$$\text{Frequency} = 1/\text{Time period}$$

# Chapter 5–A Better Sound

## *Generate a Sound*

MATLAB provides an easy way to create and manipulate sounds. In the next slides there is a sketch of what it can be done.

### Characteristics of Sound Waves

Loudness	Pitch	Quality or Timbre
<p>It distinguishes between <b>loud and feeble</b> sound. It mainly depends upon the <b>amplitude of sound</b>. Other factors are the area of the vibrating body and distance of the listener from source of sound.</p>	<p>It distinguishes between <b>shriller and flatter</b> sound.  It mainly depends upon <b>frequency of sound</b>.</p>	<p>It distinguishes <b>one sound from other having the same loudness and pitch</b>.  Both the sounds have different sound effects</p>
<p><b>High amplitude</b> - loud sound</p>  <p><b>Low amplitude</b> - feeble sound</p> 	<p><b>High frequency</b> - shriller sound shorter wavelength</p>  <p><b>Low frequency</b> - flatter sound longer wavelength</p> 	<p>Sound waves of guitar</p>  <p>Sound waves of sitar</p> 

# Chapter 5–A Better Sound

## Generate a Sound

MATLAB basically uses the *sound* command to generate sounds:

*sound(tone\_values, frequency)* generates a sound using the values of the **array** *tone\_values*, and playing *frequency* of them each second.

N.B. in order to avoid sound distortions, the values of *tone\_values* have to be normalized in the range  $[-1, 1]$ .

Generate a random sound	Generate a sound with given frequency
<pre>sr=44100;           % samples per second, in Hz d=1;               % time duration of the sound noise=rand(1, sr*d); % generates a vector of length                   % sr*d with random elements                   % in the interval [0,1]  noise=noise*2-1;   % see the N.B. above sound(noise, sr);  % play the values of noise with                   % frequency 44100 each second</pre>	<pre>sr=44100; d=1; f=1000;           % frequency of the sound t=linspace(0,d,sr*d); % check what is generated angle=2*pi*sr*d; % a sequence of sr*d angles,                 % from 0 to the length of the                 % needed wave, is generated tone=sin(angle); % computation of the tones sound(tone, sr);</pre> <p><b>% linspace can also be implemented as</b></p> <pre>t=[]; for i=1:sr*d     t=[t,i]; end t=t/sr*d;</pre>

# Chapter 5–A Better Sound

## *Generate a Sound*

errata corrigge pgg.108–109:

to record the created sounds in a sound file format, usually wave, one can use the *psychwavwrite(tone,sr,'my first wave.wav')*, function that is defined in the psychtoolbox (search for file and instructions in the folder Psychtoolbox/Psychsound).

### To add a toolbox to your default MATLAB installation

- download it;
- unzip it in a folder you like (folder suggested name: name\_of\_the\_toolbox);
- add the folder to MATLAB path (click on *Set Path*) by the *Add with Subfolders* option

# Chapter 5–A Better Sound

## *Generate a Sound*

a generic sound is the composition of various *harmonics* (single waves) having different frequencies and amplitudes. First we learn how to combine three waves with different frequencies, both having a **common base frequency** of 250Hz, and **not having** (the effect is the same as pro or noob horseriding).

### Harmonic 250 Hz sound (sawtooth wave)

```
sr=44100; f=250; d=1;
t=linspace(0,d,sr*d);

first_wave=sin(2*pi*f*t);
second_wave=sin(2*pi*(2*f)*t);
third_wave=sin(2*pi*(3*f)*t);

harmonic=first_wave+second_wave+third_wave;
harmonic=harmonic/max(abs(harmonic));
sound(harmonic,sr);
subplot(2,2,1); plot(first_wave(1:500));
subplot(2,2,2); plot(second_wave(1:500));
subplot(2,2,3); plot(third_wave(1:500));
subplot(2,2,4); plot(harmonic(1:500));
```

### Inharmonic sound – different frequencies composition

```
sr=44100; d=1;

f1=200; f2=250; f3=380;

t=linspace(0,d,sr*d);
first_wave=sin(2*pi*f1*t);
second_wave=sin(2*pi*f2*t);
third_wave=sin(2*pi*f3*t);
inharmonic=first_wave+second_wave+third_wave;
inharmonic=inharmonic/max(abs(inharmonic));
sound(inharmonic,sr);
subplot(2,2,1); plot(first_wave(1:500));
subplot(2,2,2); plot(second_wave(1:500));
subplot(2,2,3); plot(third_wave(1:500));
subplot(2,2,4); plot(inharmonic(1:500));
```

# Chapter 5–A Better Sound

## *Generate a Sound*

In order to obtain a better *sawthoot wave*, base for most of the synthesized instruments' sounds, we have to act also on the waves' amplitudes, usually by halving it time after time. The most waves are used, the most the final wave resembles the sawtooth one.

### Acting on amplitudes

```
sr=44100; f=250; d=1;  
t=linspace(0,d,sr*d);  
first_wave=1*sin(2*pi*f*t);  
second_wave=0.5*sin(2*pi*(2*f)*t);  
third_wave=0.25*sin(2*pi*(3*f)*t);  
harmonic=first_wave+second_wave+third_wave;  
harmonic=harmonic/max(abs(harmonic));  
sound(harmonic,sr);
```

### Multiple Sounds

```
sr=44100; d=0.5;  
f_do=261.6;  
f_re=293.6;  
f_mi=329.6;  
t=linspace(0,d,sr*d);  
do=sin(2*pi*f_do*t);  
re=sin(2*pi*f_re*t);  
mi=sin(2*pi*f_mi*t);  
silence=zeros(1,sr*d);  
sound([do, re, mi, silence, do],sr);
```

The last example shows how to generate a small melody of a couple of seconds by simply concatenating 5 different sounds

# Chapter 5–A Better Sound

*The remaining part of the Chapter (pagg.113–125) goes deep into the sound creation and manipulation, and it is skipped here.*

Suggested exercises: pg.125, from 1 to 6

# Chapter 6 – Create and Process Images

## Images Basics

an image is represented as an integer valued matrix, each element representing a colored pixel. The admissible values of each pixel are:

- *grey intensities*: represented as 8 bits numbers ranging from 0 (black) to 255 (white);
- **RGB triplets**: triplets of intensity values of the colors Red Green and Blue, ranging from 0 to 255 each and yielding to  $2^{24}$  different colors (**True Color**);
- **indexing color**: a number chosen in a 64 colors palette table and corresponding to an assigned triplet of RGB nuances.

**MATLAB uses indexing images by default**

### Showing palette table

```
colormap %shows palette table
MMap=colormap;
MMap(3:6,:)
Ans =
    0.2123    0.2138    0.6270
    0.2081    0.2386    0.6771
    0.1959    0.2645    0.7279
```

### Changing palette table

```
MMap=[1,0,0;0.8,0.1,0;0.1,0,0]
colormap(MMap);
% default colormap changes into MMap
img=[1 2 1 1;3 3 3 1];
image(img) % img is shown
```

# Chapter 6 – Create and Process Images

## Images Basics

ATTENTION: the default palette table is restored once the Fig. environment is closed.

a nice and useful way to change palette table:

>>colormapeditor

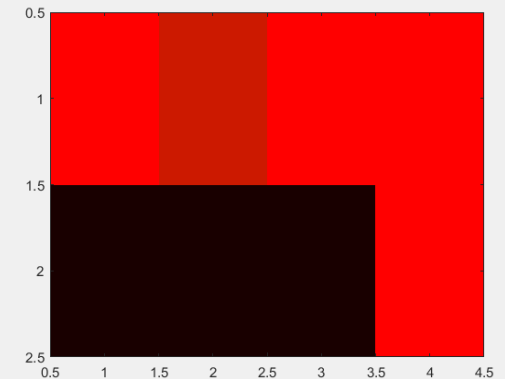

### Showing palette table

```
colormap %shows palette table
MMap=colormap;
MMap(3:6,:)
Ans =
    0.2123    0.2138    0.6270
    0.2081    0.2386    0.6771
    0.1959    0.2645    0.7279
```

### Changing palette table

```
MMap=[1,0,0;0.8,0.1,0;0.1,0,0]
colormap(Mmap);
% default colormap changes into MMap
img=[1 2 1 1;3 3 3 1];
image(img) % img is shown
```

# Chapter 6 – Create and Process Images

## *Importing and Exporting Images*

an image can be imported from outside into a variable matrix using the command  
`variable=imread('filename','file type');`

as well it can be overwritten/created using the command

`imwrite(variable;'filename','file type');`

**ATTENTION:** according to the file format (tiff, png, bmp,jpg,gif...), variable has different formats. See manual for references.

Importing an image	Comments
<pre>% choose a small colored image, say icon.bmp A=imread('icon.png','png') % imported matrix is displayed in numeric format image(A) % image is displayed imwrite(A,'icon2.png','png') % icon2 is created in the default folder</pre>	<p><i>In our example, the obtained matrix has dimension 128*128*3 since each pixel is expressed in RGB values ranging from 0 to 255 (8 bits representation). No further infos are present so using the command <code>[A,B]=imread('icon.png','png')</code> B turns out to be void. Images may have a proper palette table as additional info, that, in case, is imported into B</i></p>

# Chapter 6 – Create and Process Images

## *Display images*

there are two main functions to display images after importing with *imread* command:

–`image(A)`;

–`imshow(A, colormapofA)`; `%colormapofA` is the map color obtained with *imread*

To obtain a grayscale (100) color map use the command `colormap(gray(100))`

*For three dimensional image data the colormap is ignored*

Trick: the command `axis off` avoid displaying the axis

*Exercise:*

*create a random 128 x 128 image and display it changing the colormap*

# Chapter 6 – Create and Process Images

## *Intensity transformation:*

an image can be regarded as an integer matrix and as so, it can be manipulated:

as an example, we can enjoy increasing/decreasing its brightness by adding/subtracting to all of its entries the same value, here on 128.

Intensity transformation	Comments
<pre>A=imread('mandrill.jpg','jpg'); A1ight=floor(min(A+128,255)); % shift high the color components of mandrill Adark=floor(max(A-128,0)); % shift low the color components of mandrill A3=256-A; % invert the intensities of mandrill subplot(1,4,1);image(A); axis off subplot(1,4,2);image(A1); axis off subplot(1,4,3);image(A2); axis off subplot(1,4,4);image(A3); axis off %plot everything</pre>	<p><i>The <b>floor</b> function round a number to its maximum lower integer.</i></p> <p><i>The functions <b>min</b> and <b>max</b> allow not to exceed the 0–255 values range.</i></p> 

# Chapter 6 – Create and Process Images

## *Intensity transformation:*

to **change** a rgb image into a grayscale one use the command `rgb2gray()`

now it is even more evident the action of the brightness filtering

Changing into grayscale	Comments
<pre>A=imread('mandrill.jpg','jpg'); C=rgb2gray(A) % mandrill is grayscaled colormap(gray(256)); image(C); % plot the gray scaled mandrill image(C') % rotate mandrill</pre>	<p><i>Again considering mandrill image as an integer matrix allows us to perform mathematical operations on it.</i></p>

# Chapter 6 – Create and Process Images

## *Windowing:*

Enhance some parts of an image by multiplying it with a window of the same size whose entires are usually in the range [0,1]. A first example selects the central part of an image and the second enhances it with a gaussian window (see listing 6.2)

Create a selecting window	Comments
<pre>A=imread('mandrill.jpg','jpg'); A=rgb2gray(A) % mandrill is grayscaled window=zeros(A); centX=size(A,1)/2 centY=size(A,2)/2; %compute the center of A winsize=50 % size of the window window([-winsize:winsize]+centX, [-winsize:winsize]+centY)=1 % the center of the window is set to 1 newimage=A.*window; % the windowed image is created imagesc(newimge);</pre>	<p><i>A window of the same size of an input image that cuts its central 50x50 squared part is created.</i></p> <p><i>It is applied via standard multiplication to the input image (here mandrill.jpg)</i></p>

# Chapter 6 – Create and Process Images

*Neighborhood processing (read)*

*The Edges of the Image (read)*

*Advanced Image Processing (read)*

# Chapter 6 – Create and Process Images

## *Creating Images by Computation:*

let us now approach the design of simple images. This argument will be treated in the Psychtoolbox chapter. The following example shows how to create a line, a polyline figure and a circle.

Create different figures with two simple commands	Comments
<pre>% create a polyline with three points line([-1,2,4],[-2,0,3]) % create a red triangle fill([-1,2,4],[-2,0,3],'r') % create a circle as a closed polyline Npoints=30; x=[1:Npoints]./Npoints*2*pi; radius=3; fill(radius*sin(x)+2,radius*cos(x)+1,'r')</pre>	<p><i>A series of elements is depicted. A red circle whose center is in the point (2,1) and the radius equal to 3 is created.</i></p>

*Exercises 1 and 2 are suggested*

# Chapter 7 – Data Analysis

## *Descriptive Statistics*

### *Measures of Central Tendency*

mean(v), mode(v) and median(v)

geomean(v), harmean(v) and trimmean(v,percent)

### *Measures of dispersion*

max(v), min(v), std(v), var(v), ...

for additional measures see the **Statistics toolbox**

## *Bivariate and Multivariate Descriptive Statistics*

### *Covariance*

### *Simple and Multiple Linear Regression*

### *Generalized Linear Model*

***All the functions have a standard syntax and are easy to use when needed***

# Chapter 7 – Data Analysis

## *Inferential Statistics*

### *Parametric Statistics*

... *t-Test* (see example below) ...

### *ANOVA*

### *Nonparametric Statistics*

Test if 20 random numbers' mean is different from 0

Comments

```
[H p CI stats] = ttest(rand(20,1))
H =
    1 % the null hypothesis CAN be rejected
p = % probability of finding these results by random chance
    % very low
    4.6959e-08
CI = % confidence interval of the mean
    0.4876
    0.7964
stats = % parameters of the t-test
struct with fields:
    tstat: 8.7026
    df: 19
    sd: 0.3299
```

The *t-Test* is performed by the `ttest(v)` function that tests if the mean of a vector of values is *different from 0* with a significance level of 0.05. If a value different from 0 is required, it is the second argument input. The `ttest(v)` function also accepts *left* and *right* parameter to specify the direction of the tail test (*test >0* or *<0* only).

# Chapter 8 – The Charm of Graphical User Interface

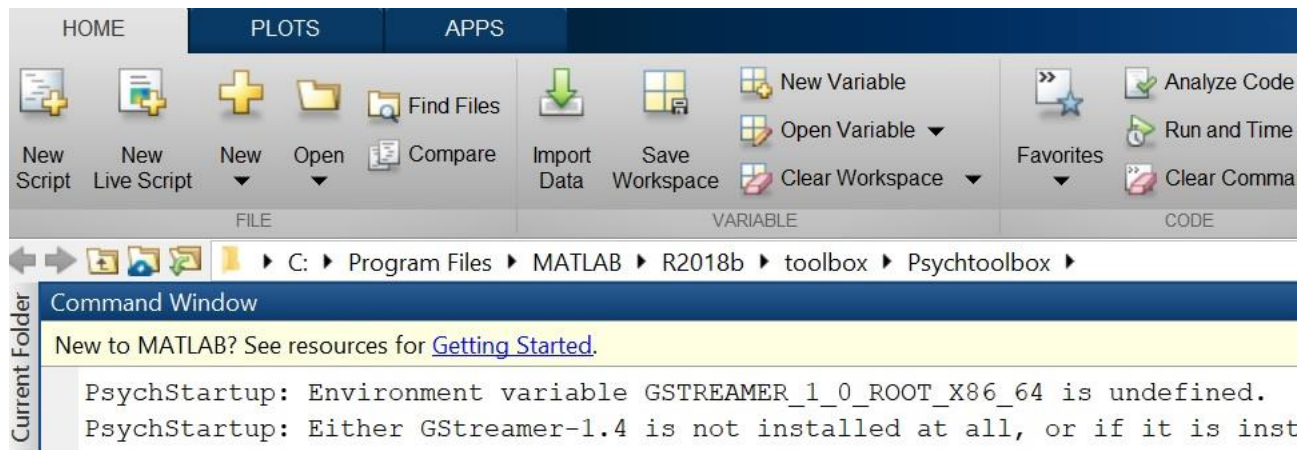

*In this chapter it is introduced a friendly way to allow the user to interact with a program we have created.*

*This part uses notions from the paradigm of Object Oriented programming and it overcomes the aims of the course.*

*We will introduce some of the functionalities here skipped in the next chapter using some functions of the Psychtoolbox.*

# PsychToolbox installation hints

1. Go to [psychtoolbox.org](http://psychtoolbox.org). Download and install the version of PsychToolbox compatible with your PC Operating System.
2. Open Matlab and set the PsychToolbox folder as working folder.

3. Run `>>SetupPsychtoolbox`
4. Answer 'no' and then 'yes' to the Matlab requests. Finally press enter two times.

# Chapter 9 – Psychtoolbox: Video

## *The Screen Function*

this is the core function of the toolbox and it is mainly used to manage graphical functions and parameters as draw geometrical shapes, import figures, get info about the HW and SW characteristics and synchronize all the stimuli.

Its general call is *Screen('SubFunctionName',parameter1,parameter2,...)*

whose help file is *Screen('SubFunctionName?')*

the following SubFunctions provide info about the HW and SW:

*Version* (version of PTB), *Computer*, *Screen* (the screens connected to the PC), *FrameRate* ...

Starting with Screen function	Comments
<pre>&gt;&gt;Screen('FillRect?') Ans = Screen('FillRect', windowPtr [,color] [,rect])  &gt;&gt;Screen (Computer)</pre>	<p>Ask for help to the <i>fillrect</i> function The parameter [ ... ] are considered as optional</p> <p>The characteristics of the computer are displayed in a <i>Struct</i> variable form</p>

# Chapter 9 – Psychtoolbox: Video

## *The Screen Function*

the use of *try ... catch ... end* is here extremely useful and it allows to bypass loops of errors with a timeout or overload detect procedure.

Example	Comments
<pre>A=imread('mandrill.jpg','jpg'); C=zeros(size(A,1),size(A,2)); try   B=A.*C   image(B) catch   disp('Error in something'); end</pre>	<p>A and C are same-size, different-type matrices, so the .* operator provide an error. Instead of showing it, 'Error in something' is displayed.</p>

# Chapter 9 – Psychtoolbox: Video

## *How to use Screen to Draw Figures*

the main feature of Screen is to present figures or drawings with the maximal timing accuracy.

Three steps are needed: *open* a figure, *draw/modify* it and *close* it.

## *Opening the Window*

To open a figure one must use ‘*OpenWindow*’ SubFunction.

Its first parameter is the screen where we want to display the figure (in case of multiscreens); the default parameter is 0. After a color RGB triplet is optional, and then the area we want to set as window, to draw inside. If no area is specified, then the whole screen area is considered.

The function returns a **pointer to the screen** and the **screen coordinates** in pixels (a 4-tuple [0,0,x,y] where (0,0) is the top-left corner, (x,y) is the bottom-right corner of the screen. Other options can be found in the on-line manual.

*Some settings are often needed in order to obtain the full functionality of the OpenWindow Subfunction*

# Chapter 9 – Psychtoolbox: Video

## Opening the Window

Example	Comments
<pre>[myscreen, rect]=Screen('OpenWindow',0,[0,255,0]);</pre> <pre>Myrect=[10,20,150,250]; Screen('OpenWindow',0,[],Myrect);</pre>	<p>Open a window of the same size as the screen, and make it green. Myscreen is a pointer to the screen, while rect is a 4-tuple with top-left pixel and the bottom-right pixel coordinates.</p> <p>Open a new rectangular window whose top-left pixel and the bottom-right pixel coordinates are (10,20) and (150,250) of the default white color.</p>

## Closing

To close the window and destroy the pointer simply write

```
Screen('CloseAll')
```

If we open **more than one window**, then we can destroy a single one, i.e., its pointer, say *pippo*, using

```
Screen('Close',pippo)
```

# Chapter 9 – Psychtoolbox: Video

## *Drawing: an Introduction* and *Reprise*

The use of Flip command: when one or more figures are drawn, they are saved in the background memory (*backbuffer*) and so not visible.

The Flip subfunction moves the figures from the backbuffer to the foreground memory (*frontbuffer*), and so they become visible.

When Flip is executed, the backbuffer is cleared and the frontbuffer is updated.

Syntax is:

*Screen('Flip',windowPtr)*

where windowPtr is a pointer to the chosen screen.

A further useful command:

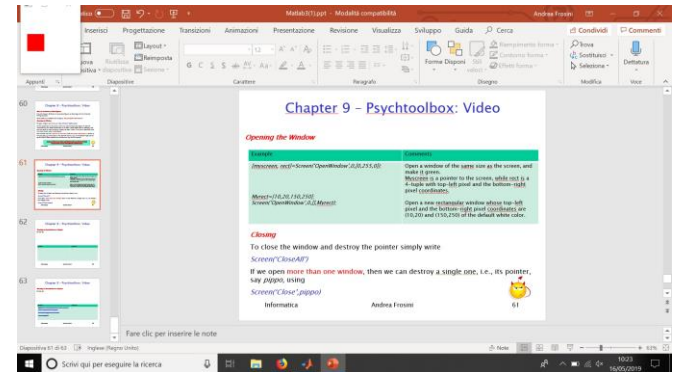

*KbWait*

that stops the execution of the code until a key-press

# Chapter 9 – Psychtoolbox: Video

## *Drawing: an Introduction and Reprise*

A simple example

### Example

```
[pippo,pluto]=Screen('OpenWindow',0,[],[10,20,100,200]);
```

```
minnie=CenterRect([0,0,50,50],pluto);
```

```
Screen('FillRect',pippo,[255,0,0],minnie);
```

```
Screen('Flip',pippo);
```

```
Screen('Close',pippo);
```

### Comments

A white small rectangular area is depicted on the top of the screen.

A 4-tuple of coordinates is created in minnie that centers the minnie rectangle inside pippo.

Minnie is red filled and placed inside pippo. Nothing is shown since the rectangle is in background.

Minnie appears since Flip sets it to foreground.

Pippo is closed and the pointer is trashed.

# Chapter 9 – Psychtoolbox: Video

## *Drawing: an Introduction and Reprise*

A simple example

Example	Comments
<pre>[pippo,pluto]=Screen('OpenWindow',0,[],[10,20,100,200]);</pre>	A white small rectangular area is depicted on the top of the screen.
<pre>minnie=CenterRect([0,0,50,50],pluto);</pre>	A 4-tuple of coordinates is created in minnie that centers the minnie rectangle inside pippo.
<pre>Screen('FillRect',pippo,[255,0,0],minnie);</pre>	Minnie is red filled and placed inside pippo. Nothing is shown since the rectangle is in background.
<pre>Screen('Flip',pippo);</pre>	Minnie appears since Flip sets it to foreground.
<pre>Screen('Close',pippo);</pre>	Pippo is closed and the pointed trashed.

# Chapter 9 – Psychtoolbox: Video

## *Drawing shapes*

A simple example. A harder and affordable one is Listing 9.4.

Example	Comments
<pre>try [mywin, mywindim]=Screen('OpenWindow', 0, [0,255,0]); myrect=[0,0,400,400];  myplacedrect=CenterRect(myrect,mywindim);  Screen('FillRect',mywin,[255,0,0],myplacedrect); Screen('Flip',mywin); KbWait; Screen('CloseAll'); catch Disp('Some errors occurred!'); End</pre>	<p><i>mywindim</i> contains the dimensions of the full screen</p> <p><i>myrect</i> contains the dimensions of the rectangle to draw (4-tuple of coordinates)</p> <p><i>myplacedrect</i> contains the coordinates to place <i>myrect</i> in the middle of <i>mywin</i></p> <p>A red rectangle is drawn and placed in the backbuffer The rectangle is shown ... ... until keypressed Finally <i>mywin</i> is closed</p>

# Chapter 9 – Psychtoolbox: Video

## *Drawing shapes*

What in the previous page is a way to proceed:

1. set the dimension of the rectangle regardless its coordinates,
2. move it in the desired position (maybe using the functions here on the right).

Function	Description
AdjoinRect	Moves a rect next to another one
AlignRect	Aligns a rect over another one
ArrangeRects	Arranges an array of rects in a pleasant way
CenterRect	Centers a rect within a second one
CenterRectOnPoint	Centers a rect around given x,y coordinates
CenterRectOnPointd	Centers rect around an x,y coordinate pair
ClipRect	Returns the intersection of two rects
ClipRect	Returns the intersection of two rects
InsetRect	Shrinks/expands rect by additive insets
IsEmptyRect	Returns 1 if empty, returns 0 otherwise
IsInRect	Is the point inside a rect?
OffsetRect	Shifts rect vertically and horizontally
RectBottom	Returns index of yBottom entry of a rect
RectCenter	Returns the integer x,y coordinates of center
RectCenterd	Returns the exact x,y coordinates of center
RectOfMatrix	Accept an image as a matrix and returns a PTB rect specifying the bounds
RectHeight	Returns the height of a rect
RectLeft	Returns index of xLeft entry of a rect
RectRight	Returns index of xRight entry of a rect
RectTop	Returns index of yTop entry of a rect
RectWidth	Returns width of a rect
RectSize	Returns the width and the height of a rect
ScaleRect	Scales a rect by multiplicative factors
SetRect	Creates a rect (i.e., a vector) from four input coordinates
SizeOfRect	Accepts a Psychtoolbox rect [left, top, right, bottom] and returns the size [rows columns] of a MATLAB array (i.e. image) just big enough to hold all the pixels
UnionRect	Smallest rect containing two given rects

# Chapter 9 – Psychtoolbox: Video

## *Drawing shapes*

If we need to manage **circles**, the functions on the right can be used

Sub/Function	Command	Description
DrawLine	Screen('DrawLine', windowPtr [,color], fromH, fromV, toH, toV [,penWidth]);	draws a line
DrawArc	Screen('DrawArc', windowPtr [,color], [rect], startAngle, arcAngle)	draws a circular arc unfilled with color (i.e., a Pac-Man-like figure)
FrameArc	Screen('FrameArc', windowPtr [,color], [rect], startAngle, arcAngle [,penWidth] [,penHeight] [,penMode])	as above
FillArc	Screen('FillArc', windowPtr [,color], [rect], startAngle, arcAngle)	as above but filled with color
FillRect	Screen('FillRect', windowPtr [,color] [,rect] );	draws a rectangle filled with color
FrameRect	Screen('FrameRect', windowPtr [,color] [,rect] [,penWidth]);	draws a rectangle unfilled with color
FillOval	Screen('FillOval', windowPtr [,color] [,rect] [,perfectUpToMaxDiameter]);	draws a filled oval
FrameOval	Screen('FrameOval', windowPtr [,color] [,rect] [,penWidth] [,penHeight] [,penMode]);	draws a framed oval
FramePoly	Screen('FramePoly', windowPtr [,color], pointList [,penWidth]);	draws a framed polygon
FillPoly	Screen('FillPoly', windowPtr [,color], pointList [, isConvex]);	draws a filled polygon

# Chapter 9 – Psychtoolbox: Video

**Batch Processing: Drawing Multiple Figures at Once** (read only)

## **Drawing Text:**

The sub-function DrawText allows one to draw text on the screen. The syntax is

```
Screen('DrawText', windowPtr, text [, x] [, y], [, color] [, ...]);
```

where x and y are the coordinates of the top left corner of the starting text.

The *DrawText* sub-function returns the **coordinates (x,y)** of the **ending point** of the inserted *text*.

Example	Format the text
<pre>try pippo=Screen('OpenWindow',0,[0,255,0]); MyText='Ciao Mario'; Screen('DrawText', pippo, MyText,40,50,[255,0,0]); Screen('Flip',0); KbWait; Screen('CloseAll'); catch disp('errore'); end</pre>	<pre>Screen('TextStyle',pippo,n) % set the textstyle of the window pippo % n ranges from 0 to 7 to have normal, bold, italic ... Screen('TextFont',pippo,'Verdana'); % changes the font into Verdana Screen('TextSize',pippo,36) % set the textsize to 36  % all those sub-functions return the previous value of the changed format</pre>

# Chapter 9 – Psychtoolbox: Video

## *Drawing Text:*

Exercise:

Draw a sequence of four randomly chosen greetings among ‘Ciao’, ‘Hi Hi’, ‘Bonjour’, ‘Hola’ of all red nuances (i.e., colors from [1,0,0] to [255, 0, 0]) in a randomly chosen position of a yellow screen.

# Chapter 9 – Psychtoolbox: Video

## *Drawing Text:*

Exercise:

Draw a sequence of four randomly chosen greetings among ‘Ciao’, ‘Hi Hi’, ‘Bonjour’, ‘Hola’ of all red nuances (i.e., colors from [1,0,0] to [255, 0, 0]) in a randomly chosen position of a white screen.

Example	Comments
<pre>try [pippo,dim]=Screen('OpenWindow',0,[],[100,100,700,700]); cheers=["Ciao","Hi Hi","Bonjour","Hola"]; Screen('TextFonts',pippo,'Arial'); Screen('TextSize',pippo,40); for i=[0:10:255]     x=randi(dim(3));     y=randi(dim(4));     MyCheers=<b>char</b>(cheers(randi(4))); % <b>WARNING!!!</b>     Screen('DrawText',pippo,MyCheers,x,y,[i,0,0]);     Screen('Flip',pippo);     pause(0.1); end KbWait; Screen('CloseAll'); catch ...end</pre>	<p>An array of <i>strings</i> is created</p> <p>We use the function <i>randi()</i> for a quick way to generate random integers.</p> <p><b>Warning:</b> the sub-function DrawText requires an <b>array of char</b> as text input, so we have to change the type of cheers from string to char!</p> <p><b>Remind that the assignment of a text string to a variable can be done using single quotes, i.e., the type will be array of characters, or double quotes i.e., the type will be a single string.</b></p>

# Chapter 9 – Psychtoolbox: Video

## *Importing Images*

Screen uses the sub-function DrawTexture to show a picture file that is in our HD.

Three steps are needed:

1. Load the image on Matlab, as seen in Chapter 6
2. Create a texture of the picture (texture is a specific way to encode a RGB or gray level image).
3. Show the picture.

Example	Comments
<pre>try A=imread('mandrill.jpg','jpg'); r=[0,0,size(A)]; [pippo,dim]=Screen('OpenWindow',0); r=CenterRect(r,dim); pic=Screen('MakeTexture',pippo,A); Screen('DrawTexture',pippo,pic,[],r); Screen('Flip',pippo); KbWait; Screen('CloseAll'); catch ...end</pre>	<p><i>Pic</i> is a pointer to the created texture Pic is inserted inside the rectangle <i>r</i> and drawn in the backbuffer. N.B. the texture and the rectangle must have the same dimension.</p>

# Chapter 9 – Psychtoolbox: Video

## Video Clips

Video clips can be created as a sequence of images showed one after the other with a small difference in position, providing the effect of movement.

They are usually created by loops as in the following example of a disc that moves from left to right on a white screen:

Example	Comments
<pre>try   [pippo, dim]=Screen('OpenWindow',0,[255,0,0],[100,100,700,700]);   discdiam=20;   disc=[0 0 discdiam discdiam];   rect=[200 200 400 400];   disc=AlignRect(disc,rect,'center','left');   for i=0:180     Screen('FillRect',pippo,[255,255,255],rect);     Screen('FillOval',pippo,[0 0 0],[disc(1)+i,disc(2),disc(3)+i,disc(4)]);     Screen('Flip',pippo);     pause(0.01);   end   Screen('CloseAll');</pre>	<p>Use of <b>AlignRect</b>: align the rectangle <i>disc</i> inside the biggest rectangle <i>rect</i> centering disc on the y-coordinate and posing on the left the x-coordinate</p>

# Chapter 9 – Psychtoolbox: Video

## *Video Clips*

Listing 9.4 can be read and understood.

## *Drawing Things at the Right Moment* (read)

Read and realize [A Brick for an Experiment](#), pg. 245.

Exercise:

Draw the picture Mandrill.jpg on a black screen and successively reduce its size view using the Windowing tool (Chapter 6), till full expiring into a full black screen.

Play a single note repeated all over the process and a final different one together with the centered big text 'Bye Bye'.

# Chapter 10 – Sound, Keyboard and Mouse

## *Timing*

- WaitSecs(n) halts the run of the program for n seconds.
- GetSecs gets the time between the start of the PC and the GetSecs call. It is extremely useful to take the time (as a subtraction) between two GetSecs calls (i.e., the visualization of a stimulus and the reaction of the subject).

## *Priority*(skip)

## *Sound Functions*

There are some functions to synthesize and play sounds that are extremely useful for psychological experiments.

The main is *PsychportAudio* whose use is similar to that of Screen.

To play a beep of a given frequency f, duration time d and sample ratio sr type

*MakeBeep(f,d,sr);*

# Chapter 10 – Sound, Keyboard and Mouse

## *Sound Functions*

A quick example

Example	Comments
<pre>try   f=500;   d=1;   sr=48000;   beep=MakeBeep(f,d,sr); % the beep is generated   %InitializePsychSound;   pippo=PsychPortAudio('Open', [], [], [], sr, 1);   PsychPortAudio('FillBuffer',pippo,beep);   PsychPortAudio('Start',pippo);   PsychPortAudio('Stop',pippo,d); catch   disp('errore'); end</pre>	<p>N.B. the sample ratio of 44100 is not always supported. In case use 48000.</p> <p>The Open sub-function contains among others, the sound ratio of the sound that will be played and the number of channels, i.e., how many different sounds will be played together.</p>

# Chapter 10 – Sound, Keyboard and Mouse

## *Getting Participants' Inputs: Keyboard and Mouse Functions*

### *Keyboard Response*

There are two main classes of keyboard events: **keypressed** and **character oriented**.

Only the first ones will be considered, since most representative for psychological experiments. In particular we consider *KbWait()* that waits for user's input, stopping the script execution until keypressed.

The function *KbWait* **returns** both the **time** before keypressed and the (code of the) **key** pressed. This code is a 256 boolean array with one only 1 in the character–pressed–code position (see the example in the next slide).

One can switch between code of a keyboard key and its name by means the function *KbName()*.

Example: *KbName('c')* returns the code 67, and *KbName(67)* returns the character 'c'.

# Chapter 10 – Sound, Keyboard and Mouse

*Press any key to proceed*

*Press the Spacebar to proceed*

Press any key to proceed

```
try
  [pippo,rect]=Screen('OpenWindow',0)
  DrawFormattedText(pippo,'PRESS ANY KEY TO_
  PROCEED','center','center');
  Screen('Flip',pippo);
  KbWait,
  Screen('CloseAll');
catch
  disp('errore');
End
```

Press Spacebar to proceed

```
try
  [pippo,rect]=Screen('OpenWindow',0);
  DrawFormattedText(pippo,'PRESS SPACEBAR TO
  PROCEED','center','center');
  Screen('Flip',pippo);
  spax=KbName('space');
  [tmp,code]=KbWait;
  while code(spax)==0
  [tmp,code]=KbWait;
  end
  Screen('CloseAll');
catch
  disp('errore');
end
```

# Chapter 10 – Sound, Keyboard and Mouse

## *Press any key to respond*

Here the previous two examples are extended asking the subject to produce a y/n output. Listing 10.7 expresses the code: a sequence of text stimuli are presented and required to the subject a y/n response. The sequence of responses are recorded in a boolean vector.

*Exercise ‘Animals’*: extend Listing 10.7 by creating the following game: create a 6 words vector, i.e., 3 animals and 3 objects, and a boolean vector of ‘right answers’. Then asks the subject to press a (animal) or o (object) correctly according to ten times randomly presented words.

At the end of the session compute the total score of the subject.

## *Reaction time detection*

Usually some tasks requires a subject to react as faster as possible to some events, and successively, the reaction timea are gathered.

To do so, the KbWait time is collected, saved and processed.

# Chapter 10 – Sound, Keyboard and Mouse

## *Reaction time detection*

Due to the relevance of the setting, hereafter a simplest code is provided. This code has to be fully understood.

Reaction time detection	Comments
<pre>[pippo,rect]=Screen('OpenWindow',0,[],[100 100 700 700]); DrawFormattedText(pippo,'PRESS ANY KEY TO                     PROCEED','center','center');  Screen('Flip',pippo); KbWait; ntrials=5; rt=zeros(ntrials,1); for i=1:ntrials WaitSecs(1); Screen('FrameOval',pippo,[255 255 255],         CenterRect([0 0 10 10],rect));  oval_time=Screen('Flip',pippo); Screen('FillRect',pippo,[255 0 0],CenterRect([0 0 50 50],rect)); Screen('Flip',pippo,oval_time+1+rand); t0=GetSecs; [t1, trash0]=KbWait; rt(i)=t1-t0; Screen('Flip',pippo);</pre>	<p>Five trials are programmed</p> <p>Draw a oval and show it</p> <p>Draw a rectangle and show it AFTER 1 +rand seconds of the oval show</p> <p>Time of the key press is gathered and subtracted to the time the rectangle is shown in order to obtain the reaction time.</p> <p>The screen is then cleared.</p>

# Chapter 10 – Sound, Keyboard and Mouse

*Choice Reaction time* (read)

*Go/No-Go reaction time* (read)

A simple modification to the previous listing can be done to obtain the reaction time according to a key pressed choice. As an example we can require to press R or G as fast as possible according to the randomly shown red or green circle.

*Reaction time within a video clip* (read)

# Chapter 10 – Sound, Keyboard and Mouse

## *Mouse Input*

the mouse is a valuable tool to get inputs and information from a subject. The main functions that manage its inputs are:

- `[x,y,button]=GetMouse()` : `(x,y)` is the mouse position, while `button` is a boolean vector with as many elements as the number of buttons in the mouse. The elements are all 0 but that corresponding to the pressed button.
- `[numclicks,x,y,button] = GetClicks` : as get mouse, with a first output to save the number of clicks info.
- `SetMouse(x,y)` : set the mouse in position `(x,y)`
- `HideCursor, Showcursor`

# Chapter 10 – Sound, Keyboard and Mouse

## *Mouse Input* A simple example

Reaction time detection	Comments
<pre>[pippo,rect]=Screen('OpenWindow',0); HideCursor; WaitSecs(3); ShowCursor; WaitSecs(3); for i = 1:3     SetMouse(rect(3)/2,rect(4)/4,pippo);     WaitSecs(2); end [clicks,x,y,button]=GetClicks; Screen('CloseAll');</pre>	<p><i>The cursor is hidden and shown later</i></p> <p><i>Three times the cursor is placed in a fixed position</i></p> <p><i>A click is waited and the position is saved</i></p>

In Exercise 'Animals' add the possibility of answering by clicking with the mouse on two red and green rectangles on the left and on the right of the word. Furthermore, take care of the reaction time of each player.

Read till the end of the chapter

# Chapter 10 – Sound, Keyboard and Mouse

## Exercise Animals

```
word=["cat","mouse","dog","bottle","pen","cup","a","a","a","o","o",  
"o"];  
[pippo,rect]=Screen('OpenWindow',0,[0 255 0],[100 100 500  
500])  
DrawFormattedText(pippo,'PRESS ANY KEY TO  
PROCEED','center','center');  
Screen('Flip',pippo);  
KbWait;  
x=rect(3)/2;  
y=rect(4)/2;  
results=zeros(1,10);
```

```
for i= 1:10  
j=randi(6);  
MyCheers=char(word(1,j))  
  
Screen('DrawText',pippo,MyCheers,x,y,[255,0,  
0]);  
Screen('Flip',pippo);  
[tmp,code]=KbWait;  
pause(0.5);  
if code(KbName(char(word(2,j))))==1  
results(i)=1;  
end  
end  
Screen('CloseAll');  
disp(results);
```

# Chapter 10 – Sound, Keyboard and Mouse

Mouse click on two buttons and get the answer

```
script bottoni  
[clicks,x,y,button]=GetClicks;  
  disp([x y]);  
if ((x>50)&(x<100)&(y>300)&(y<350))  
  answr="a";  
elseif ((x>300)&(x<350)&(y>300)&(y<350))  
  answr="o";  
else  
  answr="e";  
end  
if (answr==word(2,j))&(rtime<2)  
  results(1,i)=1;  
  results(2,i)=rtime;  
end
```

Create two buttons on a [0 0 400 400] rectangle

```
push1=[50, 300, 100, 350];  
push2=[300, 300, 350, 350];  
Screen('FillOval',pippo,[0 255 0],push1);  
Screen('DrawText',pippo,'A',60, 305);  
Screen('TextColor',pippo,[0 0 255]);  
Screen('FillOval',pippo,[255 0 0],push2);  
Screen('DrawText',pippo,'O',310, 305);
```
