Other Site Characteristics

Principale complesso montuoso o alto-collinare del Chianti a substrato prevalentemente arenaceo. Area in gran parte boscata con frequenti stadi di degradazione a dominanza di *Cytisus scoparius* ed *Erica scoparia* talora con *Ulex europaeus*.

4.2 Quality and importance

L'alternanza di boschi, stadi di degradazione arbustivi e alcune aree aperte favorisce la presenza di rapaci che utilizzano i diversi ambienti (*Circus gallicus*, *Pernis apivorus*). Le aree aperte e le brughiere ospitano altre specie ornitiche nidificanti rare e minacciate. I corsi d'acqua, seppur di modesta portata, scorrono in aree a buona naturalità e relativamente indisturbate e presentano una fauna ittica ben conservata. Si segnala, tra gli Anfibi, la presenza di popolazioni relitte di *Triturus alpestris apuanus*, di un endemismo dell'Italia appenninica (*Rana italica*) e di un genere endemico dell'Italia peninsulare (*Salamandrina terdigitata*). Presenza di numerosi invertebrati endemici e localizzati.
